Main articles: [Weak artificial intelligence](#) and [Artificial general intelligence](#)

AI researchers are divided as to whether to pursue the goals of artificial general intelligence and [superintelligence](#) directly or to solve as many specific problems as possible (narrow AI) in hopes these solutions will lead indirectly to the field's long-term goals.^{[438][439]} General intelligence is difficult to define and difficult to measure, and modern AI has had more verifiable successes by focusing on specific problems with specific solutions. The sub-field of artificial general intelligence studies this area exclusively.

Machine consciousness, sentience, and mind

Main articles: [Philosophy of artificial intelligence](#) and [Artificial consciousness](#)

There is no settled consensus in [philosophy of mind](#) on whether a machine can have a [mind](#), [consciousness](#) or [subjective experiences](#) in the same sense that human beings do. This issue considers the internal experiences of the machine, rather than its external behaviour. Mainstream AI research considers this issue irrelevant because it does not affect the goals of the field: to build machines that can solve problems using intelligence. [Russell](#) and [Norvig](#) add that "[t]he additional project of making a machine conscious in exactly the way humans are is not one that we are equipped to take on."^[440] However, the question has become central to the philosophy of mind. It is also typically the central question at issue in [artificial intelligence in fiction](#).

Consciousness

Main articles: [Hard problem of consciousness](#) and [Theory of mind](#)

[David Chalmers](#) identified two problems in understanding the mind, which he named the "hard" and "easy" problems of consciousness.^[441] The easy problem is understanding how the brain processes signals, makes plans and controls behaviour. The hard problem is explaining how this *feels* or why it should feel like anything at all, assuming we are right in thinking that it truly does feel like something ([Dennett's consciousness illusionism](#) says this is an illusion). While human [information processing](#) is easy to explain, human [subjective experience](#) is difficult to explain. For example, it is easy to imagine a colour-blind person who has learned to identify which objects in their field of view are red, but it is not clear what would be required for the person to know what red looks like.^[442]
